#### SECTION 12: Ecological information

##### Ecotoxicity

**Biodegradation** : This material is inorganic and not subject to biodegradation.

**12.1. Toxicity** : Toxic to daphnia and other aquatic invertebrates; 2.400mg/l-48h EC50 (OECD Test Guidelines 202)

**Toxic to fish** : Lepomis macrochirus:LC50 10.650mg/l -96hr (OECD Test Guidelines 202)  
LC50, water flea Daphnia magna: 759 – 3,005mg/l

**12.2. Persistence** : Calcium Chloride is believed not to persist in the environment because it is readily dissociated into Calcium and Chloride ions in water. Calcium Chloride released into the environment is thus likely to be distributed into water in the form of calcium and chloride ions. Calcium ions may remain in soil by binding in soil particulate or by forming stable salts with other ions. Chloride ions are mobile and eventually drain into surface water. Both ions originally exist in nature, and their concentration in surface water will depend on various factors, such as geological parameters, weathering, and human activities.

## SAFETY DATA SHEET

### OZMO Moisture Absorber & Odour Neutraliser - Cotton Fresh

**According to Regulation (EC) No 1272/2008,CLP, as amended. Commission Regulation (EU) No 1907/2006**

**. Bio accumulative Potential** : Calcium chloride and its dissociated forms (Calcium and Chloride ions) are ubiquitous in the environment. Calcium and chloride can also be found as constituents in organisms. Considering its dissociating properties, calcium chloride is not expected to accumulate in living organisms.

**. Bio Concentration Potential** : No bioconcentration is expected because of relatively high water solubility. Potential for mobility in soil is very high (Koc between 0 and 50). Partitioning from water to n-octanol is not applicable.

**12.3. Mobility in soil** : Calcium Chloride is not expected to be absorbed in soil due to its dissociation properties, and high water solubility. It is expected to dissociate into calcium and chloride free ions or it may form stable inorganic or organic salts with other counter ions, leading to different fates between calcium and chloride ions in soil and water components. Calcium ions may bind to soil particulate or may form stable inorganic salts with sulphate and carbonate ions. The chloride ion is mobile in soil and eventually drains into surface water because it is readily dissolved in water.

**12.4. Results of PBT and vPvB assessment:** This substance/mixture contains no components to be either persistent, bio accumulative and toxic (PBT), or very persistent and very bio accumulative (vPvB).

Not classified as PBT and vPvB by current EU Criteria.

#### 12.5. Other adverse effects
